Hospitalizations Resulting from Assault (Three-Year Average)
number and rate/100,000 youth ages 10-19 years (2012-2014)

Why This Matters:
The rate of hospitalizations resulting from an assault is an important indicator of the relative safety of the home and community environments in which children are being raised.

Promoting safe communities by reducing violent and abusive behavior has been identified as a priority area by both National Healthy People 2010 (U.S. Department of Health and Human Services, 2000) and Communities Working Together for a Healthier New York (NYS Public Health Council, 1996).

The assault hospitalization rate is based on the number of discharges for hospitalizations resulting from an assault among youth ages 10 through 19 years per 100,000 population in this age group. Because the number of children hospitalized for assault injuries is very low in many counties in New York State, the assault hospitalization rates are presented as three-year averages.
