STD - Reported Cases of Chlamydia, Females - all ages
number and rate/100,000 females all ages (2012-2014)

Why This Matters:
Chlamydia is a bacterial infection that is spread by sexual contact with an infected person. Chlamydia is one of the most common sexually transmitted diseases. Most often, Chlamydia occurs in adolescents and young adults (ages 15-24) who have new or multiple sex partners and who do not consistently use condoms or other barrier contraception.

Gonorrhea (Neisseria gonorrhoeae) is an infection that grows and multiplies quickly in moist, warm areas of the body including the urethra, the throat and the rectum. In women, the cervix is often the site of infection.

The incidence rates for Chlamydia and gonorrhea are based on the number of reported cases of each sexually transmitted disease (STD) per 100,000 population at risk (e.g., females aged 15-19 years). Because the incidence of Chlamydia and gonorrhea is a relatively rare event in many counties, both the counts and rates presented here are based on three-year averages.
