**Unintentional Injuries - Hospitalizations birth to 19 years**

Number and rate/100,000 children/youth ages birth to 19 years (2012-2014)

**Why This Matters:**
Injuries that are so serious as to cause hospitalization may result in temporary or permanent disability. They are among the leading causes of death for children and youth and are one of the most preventable.

The unintentional injury rate is based on the number of hospitalizations for unintentional injuries per 100,000 children and youth ages birth through 19 years. This includes injuries caused by such occurrences as motor vehicle crashes, drowning, fires, and falls.

The unintentional injury mortality rate is based on the number of deaths for unintentional injuries per 100,000 children and youth ages birth through 19 years. The numbers and rates are presented as three-year averages. Three-year averaging improves the reliability of the data in counties with small populations where slight variations in the number of deaths can result in large fluctuations in their annual rates.

**Data Provider:**
NYS Department of Health
