Motor Vehicle Crashes - Hospitalizations (Three-Year Average)

Number and rate/100,000 youth/young adults ages 15-24 years (2012-2014)

Why This Matters:
Motor vehicle crashes are the second leading cause of hospitalizations due to injury for young adults ages 15 through 24 years and one of the leading causes of death among young adults. Driving while intoxicated and the relationship between speed limits, aggressive driving and traffic fatalities are among the issues facing young drivers. Further, the increased use of seat belts would decrease the mortality rate for older children and adolescents (Public Health Policy Advisory Board, 1999).

The hospitalizations resulting from motor vehicle crashes rate is based on the number of hospitalizations for motor vehicle crashes per 100,000 ages 15 through 24 years. Since hospitalizations resulting from motor vehicle crashes are relatively rare events in many counties, the numbers and rates are presented as three-year averages.

Motor vehicle mortality is the number of deaths for youth aged 15 through 24 years. The numbers and rates per 100,000 ages 15 through 24 years are presented as three-year averages.
